FABER

ALUMINIUM SERIE
 "WTD" Wing Traction Decking
 Tamis à ailes de traction

The North Cliff snowshoe was created with idea of offering an affordable and easy to use day hiking snowshoe for mountainous terrain. Our patented wing traction decking design makes efficient use of materials, allowing use to build snowshoe that is 20 % lighter than standard aluminium models, as well as making it greener, more affordable and easier to walk with. The North Cliff features our unique three adjustment heel lifter to reduce muscles fatigue during climbs. This snowshoe has all the technical specifications needed for any snowshoer who is looking for a quality, long lasting all around snowshoe.

The Wing Traction Decking «WTD» is Faber & Co most recent innovation. Built with low impact copolymer, this decking is assembled on a U shape frame, allowing us to build a lighter, more durable and a high performance snowshoe. Our copolymer is treated against UV rays and can resist temperature of minus 40 degrees Celsius. Assembled on aluminum open tail frame, the WTD deck creates traction wing and oriented exit holes to easily discharge the snow from the decking. The torsion of every wing makes a better structured snowshoe compared to standard closed frame snowshoe. Furthermore, the split tail design allows each side of the frame to flex independently to adapt to uneven terrains and reduces dragging effect while walking. Call us for more info.
