### About this product:

Faber is proud to present a simple yet very efficient design. Stronger than conventional soft decking, this new generation of snowshoes is assembled with a new light and sturdy patented Wing Traction Decking, made out of low temperature impact copolymer (- 40 Celsius). The sturdiness is due to the decking wing torsion, giving extra traction and creating exit holes for snow. The aluminium frame with curved open rear end is lighter, eases unloading of snow and avoids dragging effect while walking.

This snowshoe features a torsion effect rubber band pivot made out of strong nylon webbing coated with urethane. The torsion effect will avoid the snowshoe hitting the shine bone, eases backward steps and jumps over obstacles. This pivoting system is perfect for either trail or packed snow condition.

This snowshoe is equipped with a Trio 1LR binding (1 lever ratchet + toe box) plus a foot bed and heel piece design to maximise control of snowshoe. These series are also equipped with a 4.5 inch long aluminium front crampon and a 3 inch long heel crampon for best traction on any grounds.
